Comments

The passenger compartment of the LEAF remained stable in the frontal offset test. Protection of the front passenger dummy was good for all critical body areas. Dummy readings indicated that the dummy head had made contact with part of the vehicle interior, suggesting that there was insufficient pressure in the airbag. Protection of the knees and femurs was good for both front dummies. Nissan showed that a similar level of protection would be provided to occupants of different sizes and to those sitting in different positions. In the full-width rigid-barrier test, protection of the driver dummy was good but readings indicated that the lap section of the seatbelt had slipped from the pelvis, and protection for this body region was downgraded. Readings from the chest of the rear passenger dummy indicated marginal protection. In both the side barrier test and the more severe side pole impact, protection of all critical body regions was good and the LEAF scored maximum points in these tests. Tests on the front seats and head restraints demonstrated good protection against whiplash injury in the event of a rear-end collision. A geometric assessment of the rear seats indicated marginal whiplash protection. The autonomous emergency braking system performed well in tests at the low speeds, typical of city driving, at which many whiplash injuries are caused.

Comments

In the frontal offset test, protection of both dummies was good apart from the neck of the 10-year dummy, protection of which was rated as weak owing to measured values of tensile forces. The front passenger airbag can be disabled to allow a rearward-facing child restraint to be used in that seating position. Clear information is provided to the driver regarding the status of the airbag and the system was rewarded. All of the restraint types for which the LEAF is designed could be properly installed and accommodated in the car.

Vulnerable Road Users	7.1 Pts
System Name	Intelligent Emergency Braking with Pedestrian and Cyclist Recognition
Type	Auto-Brake with Forward Collision Warning
Operational From	10 km/h

Comments

The protection provided by the bonnet to the head of a struck pedestrian was predominantly adequate, with some poor results recorded only on the stiff windscreen pillars. The protection provided to pedestrians' legs and pelvic region was good and the LEAF scored maximum points in these tests. Overall, the autonomous emergency braking system performed adequately in tests of its protection of vulnerable road users, with performance ranging from good to marginal in the individual test scenarios.

AEB Interurban

2.4 Pts

System Name	Intelligent Emergency Braking system
Type	Autonomous Emergency Braking and Forward Collision Warning
Operational From	5 km/h
Additional Information	No supplementary warning or restraint activation

Comments

The LEAF has a seatbelt reminder system for the front and rear seats but missed out on full points as it lacks occupant detection in the rear seats. A standard-fit, camera-based speed assistance system informs the driver of the appropriate limit, allowing the driver to set the speed limiter appropriately. The lane support system also uses the camera to help the driver not to drift out of lane. This system needs to be activated by the driver and does not switch on by default at the start of a journey. The autonomous emergency braking system performed well overall in tests of its functionality at highway speeds, with good performance in most of the test scenarios.
