Comments

The passenger compartment of the UX remained stable in the frontal offset test. Dummy readings indicated good protection of the knees and femurs for both the driver and passenger. Lexus showed that a similar level of protection would be provided to occupants of different sizes and to those sitting in different positions. In the full-width rigid barrier test, protection was good or adequate for both the driver and rear seat passenger. In both the side barrier and the more severe side pole tests, maximum points were scored, with good protection of all critical body regions. Tests on the front seats and head restraints demonstrated good protection against whiplash injuries in the event of a rear-end collision. A geometric assessment of the rear seats also indicated good whiplash protection. The standard-fit autonomous emergency braking system scored full points in tests of its functionality at the low speeds at which many whiplash injuries occur, with collisions avoided at all test speeds and overlaps.

Comments

In the frontal offset test, protection of the 6 and 10 year dummies was good apart from the neck, protection of which was adequate. In the side barrier test, full points were scored with good protection of all critical parts of the body. The front passenger airbag can be disabled to allow a rearward-facing child restraint to be used in that seating position. Clear information is provided to the driver regarding the status of the airbag and the system was rewarded. All of the restraint types for which the UX is designed could be properly installed and accommodated.

Pre Crash System as part of Lexus Safety System +
Auto-Brake with Forward Collision Warning
10 km/h

Comments

The protection provided by the bonnet to the head of a struck pedestrian was predominantly good or adequate. The bumper provided good protection to pedestrians' legs at all test locations, and scored maximum points. Protection of the pelvis was more mixed but was largely good or adequate. The AEB system of the UX can detect vulnerable road users, as well as other vehicles. The system scored maximum points in tests of its performance in reacting to pedestrians with collisions avoided in all scenarios, and it performed well in tests of its cyclist detection.

Туре	Autonomous Emergency Braking and Forward Collision Warning
Operational From	10 km/h

Comments

The AEB system performed well in tests of its reaction to other vehicles at highway speeds. The lane support system helps to prevent inadvertent drifting out of lane but does not intervene in more critical situations, as do the systems of some other vehicles. The speed assistance system uses a camera to determine the local speed limit. The limit is presented to the driver and offers the opportunity to set the limiter to the speed shown. There is a seatbelt reminder for the front and rear seats.
