Comments

The passenger compartment of the Taycan remained stable in the frontal offset test. Dummy readings indicated good protection of the knees and femurs of the driver and passenger. Porsche showed that a similar level of protection would be provided to occupants of different sizes and to those sitting in different positions. In the full-width rigid barrier test, protection of all critical body areas was good or adequate for both occupants, with the exception of the rear passenger's chest, for which dummy readings of compression indicated a marginal level of protection. In the side barrier impact, protection of all critical body areas was good and the car scored full points in this tests. In the more severe side pole test, protection of the chest was adequate and that of other body areas was good. Tests on the front seats and head restraints demonstrated marginal protection against whiplash injuries in the event of a rear-end collision. A geometric assessment of the rear seats also indicated marginal whiplash protection. The standard-fit autonomous emergency braking (AEB) system performed well in tests of its functionality at the low speeds at which many whiplash injuries occur. However, the Taycan was not awarded the points for these tests as good dynamic performance in the front seats is a prerequisite for AEB scoring.

Comments

In the frontal offset test, protection of all critical body areas was good for both dummies except the neck of the 6 year dummy, protection of which was rated as marginal on the basis of tensile forces measured in the dummy. In the side barrier test, protection of all critical body areas was good and the Taycan scored maximum points in this part of the assessment. The front passenger airbag can be disabled to allow a rearward-facing child restraint to be used in that seating position. Clear information is provided to the driver regarding the status of the airbag and the system was rewarded. One universal child restraint could not be positioned stably in the rear centre seat. Otherwise, all of the restraint types for which the Taycan is designed could be properly installed and accommodated in the car.

System Name	Warning and Brake Assist
Type	Auto-Brake with Forward Collision Warning
Operational From	10 km/h

Comments

The Taycan has an active, deployable bonnet. Sensors in the bumper detect when a pedestrian has been struck and actuators lift the bonnet surface to provide greater clearance to the stiff structures in the engine compartment. Porsche showed that the system worked robustly for different pedestrian statures and across a wide range of speeds, so tests were performed with the bonnet in the raised position. Protection was good or adequate at almost all test locations on the bonnet. The bumper provided good protection to pedestrians' legs and protection of the pelvis was also good. The Taycan's AEB system can detect vulnerable road users like pedestrians and cyclists, as well as other vehicles. In tests, the system's response to cyclists was good, with collisions avoided or mitigated in most cases, and its response to pedestrians was adequate.

AEB Inter-Urban

2.1 / 3 Pts

System Name	Warning and Brake Assist
Type	Autonomous Emergency Braking and Forward Collision Warning
Operational From	10 km/h
Additional Information	Supplementary warning

Comments

The Taycan has a seatbelt reminder system for the front and rear seats. The AEB system performed adequately in tests of its response to other vehicles at highway speeds. A lane support system helps prevent inadvertent drifting out of lane. A speed assistance system uses a camera and digital mapping to determine the local limit, and presents this information to the driver who can allow the system to adapt the limiter as appropriate.
