Comments

The passenger compartment of the Toyota Yaris Cross remained stable in the frontal offset test. Protection of the driver's chest was rated as weak, based on dummy readings of compression. Head injury values during the test were not excessive but the head contacted the steering wheel owing to inadequate airbag pressure, and protection was downgraded to adequate. Femur loads were elevated, and some structures in the dashboard considered a risk to occupants of different sizes and to those sitting in different positions. Analysis of the deceleration of the impact trolley during the test, and analysis of the deformable barrier after the test, revealed that the Toyota Yaris Cross would be a benign impact partner in a frontal collision. In the full-width rigid barrier test, protection of the driver's chest was marginal but other critical parts of the body were at least adequately protected. In the side barrier test, the Toyota Yaris Cross provided good or adequate protection to all critical body areas. In the more severe side pole impact, protection was good or adequate for all critical body areas. Control of excursion (the extent to which a body is thrown to the other side of the vehicle when it is hit from the far side) was found to be marginal. The Toyota Yaris Cross has a countermeasure to mitigate against occupant-to-occupant injuries in such impacts. The airbag performed well in Euro NCAP's tests with dummy readings indicating good protection for both the driver and passenger. Tests on the front seats and head restraints demonstrated good protection against whiplash injuries in the event of a rear-end collision. A geometric analysis of the rear seats also indicated good whiplash protection. The car has an advanced eCall system which alerts the emergency services in the event of a crash, and a system to prevent secondary impacts after the car has been in a collision. Toyota demonstrated that the doors and windows would be openable to allow occupants to escape in the event of vehicle submergence.

Comments

In the frontal offset test, protection of all critical parts of the body was good or adequate for both the 6 and 10 year dummies. In the side barrier impact, protection of all critical parts of the body was good for both the 6 and 10 year dummies. The front passenger airbag can be disabled to allow a rearward-facing child restraint to be used in that seating position. Clear information is provided to the driver regarding the status of the airbag and the system was rewarded. The Toyota Yaris Cross is not equipped with 'child presence detection', a system which can alert others if children have been left in the car. All of the child restraint types for which the Toyota Yaris Cross is designed could be properly installed and accommodated in the car.

Changing lane across the path of an overtaking motorcyclist	

Comments

Protection of the head of a struck pedestrian or cyclist was largely good or adequate, with poor results recorded on the stiff windscreen pillars and at the base and top of the screen. Protection of the pelvis was good at all test locations. Protection of the femur was good at all test locations, while that of the knee and tibia was good or adequate at all test locations. The autonomous emergency braking system of the Toyota Yaris Cross responds to vulnerable road users such as pedestrians and cyclists, as well as to other vehicles. In tests of its response to pedestrians, the system performed adequately. Detection of thos to the rear of the car is available as an option but is not included in this assessment. Protection against 'dooring', where a door is opened in to the path of a cyclist approaching from behind, is also an option and not assessed here. Otherwise, the system performed well in tests of its reaction to cyclists, while its response to motorcyclists was also good.

Comments

Overall, the performance of the autonomous emergency braking (AEB) system was good in tests of its reaction to other vehicles. A seatbelt reminder system is fitted as standard to the front and rear seats. The car has an indirect driver status monitoring system as standard, detecting driver fatigue but not distraction. The lane support system gently corrects the vehicle's path if it is drifting out of lane and also intervenes in some more critical situations. The speed assistance system identifies the local speed limit. The driver can choose to allow the limiter to be set automatically by the system.
